Constraints:

- initial state, starting conditions
- acting boundary conditions (to move within): e.g. demography, economical and political stability, labor force, education and know-how, health and technological level
- access to limited resources: e.g. chemical elements, minerals, fuels, commodities, trade and transportations, etc.
- contractual agreements and covenants, legal assurance
- juristic law framework

Modelling movement (change of state) under constraints:

1. Movement is characterized by change of energy, Lagrangian $\mathcal{L} \neq 0$:

$$\mathcal{L} = \mathcal{K} - \mathcal{U} \quad \frac{\partial \mathcal{L}}{\partial r} = F \quad \frac{\partial \mathcal{L}}{\partial v} = p \quad (1)$$

2. Movement happens within constraints of forces. Constraints are observable, whereas forces might be unknown. Therefore, r can be determined from \mathcal{L} (Energy and Work) of the **system at rest** $F = 0$, instead than from “searching” all acting forces F_i . In general, unknown forces at motion are defined by solving the Eigenvalueproblem. Solving for \mathcal{L} at equilibrium:

$$F_{total} = \hat{F}_i + \tilde{F}_i = \hat{F}_i + \sum_{k=1}^{s_d} \lambda_k a_{ki} = \frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial v_i} \right) - \frac{\partial \mathcal{L}}{\partial r_i} = \begin{cases} = 0 : \text{Equilibrium} \\ \neq 0 : \text{Movement} \end{cases} \quad (2)$$

and at same time solving for constraining conditions that hold the system at rest (equilibrium):

$$\sum_{l=1}^f a_{kl} v_l + b_k = 0 \quad (3)$$

3. Rest is characterized by unchanged energy, Hamiltonian $\mathcal{H} = E_{kin} + E_{pot} = const..$ There is movement from state of rest if the new $\mathcal{H} \neq 0$ differs from the initial one. Using the found solution for the Lagrangian \mathcal{L} containing the constraints, the Hamiltonian for the energy is deduced:

$$\mathcal{H} = \sum_i p_i v_i - \mathcal{L} = p v - \mathcal{L} = F r - \mathcal{L} = W - \mathcal{L} = (\Delta E - \Delta H) - \mathcal{L} \quad (4)$$

-
4. Change of state/position is characterized by movement. Eventually, by solving the new system of differential equations, from the found solution of the energy \mathcal{H} , the set r, v, p which describe the movement (and thus the change of state), is deduced:

$$\dot{r}_i = v_i = \frac{\partial \mathcal{H}}{\partial p_i} \quad \dot{p}_i = F_i = -\frac{\partial \mathcal{H}}{\partial r_i} \quad (5)$$

see description of “work” ?@eq-workgeom

where:

s_d = constraints $i = 1, \dots, f$ = degrees of freedom $k = 1, \dots, s_d$ = constraints

\hat{F}_i = known constraining forces $\tilde{F}_i = \sum_{k=1}^{s_d} \lambda_k a_{ki}$ = unknown constraining forces

$\lambda_k(t)$ = Eigenvalues for transformation of reference system

a_{ki} = Eigenvectors of transformation matrix

$\lambda_k \cdot \vec{r}_i = \lambda_k \cdot [a_{ki}]_{matrix}$
